**Subject:** Re: Testing DataONE MN

**Importance:** High

Hi Everyone,  
thank you for the detailed reports. Many of the items detailed there appear to be general issues with the search UI and or the indexing rules that we will address in upcoming releases - your observations are very helpful there. In particular the observed issues with faceted search appear to be caused by our general indexing rules for ISO metadata. These are being reviewed and we hope to have resolved in the near future, though we see those as independent of the IEDA content and should not delay the IEDA MN deployments.

Issues such as icon paths, node descriptions, and names can and will be resolved with transition to production, and so it is important that we have on record the expected name, node description, and logo ready for the production deployment.

Overall, the MNs appear to be functioning as expected, and the issues identified are related to information contained in the node registration, the metadata indexing rules for ISO metadata, or the search UI. The only issues that seem to be MN related pertain to the information contained in the "Metadata Contacts" display for datasets and the occasional invalid JSON-LD. Both of these would need to be addressed on the MN side, though do not block deployment of the nodes.

Other items are addressed specifically below.

USAP-DC

Small portion of datasets showing. This is because of a misconfiguration on our side early in the harvesting process. We have tested the synchronization functionality and are confident that records will be harvested as expected when moving to production.

USAP-DC, MGD and ECL

The repo descriptions will be added with the move to production, and are documented in the respective issue tracker entries:

USAP-DC: <https://redmine.dataone.org/issues/8721>

MGDL: <https://redmine.dataone.org/issues/8704>

ECL: <https://redmine.dataone.org/issues/8035>

ECL

Online Resources Linkage: That entry appears under "Metadata Contacts" and is pulled directly from the ISO metadata. If the link is broken then it needs to be updated in the source metadata.

MN name is corrected (was an issue with the node registration).

Searching for publish year: This appears to be an indexing issue with ISO metadata. It will be addressed in the broader indexing updates mentioned above.

Total datasets: there are occasional synchronization issues caused by invalid JSON-LD being presented by the IEDA server. Once corrected they will synchronize with DataONE.

Submissions marked as external resources: DataONE indexes what is presented by the repository. Third party links are not processed.

Bugs mentioned:

Only results with data checkbox: confirmed as a UI bug

Year sliding bar: Agreed. Will add as a feature request, though is one of those things that is challenging across many diverse repositories.

Counter download button increments: There is a latency of about 24hrs in the event updates.

Location filter: Known issue, to be addressed in indexing rule updates.

Taxon filter info: Agreed. Will be added as a feature request.

Sort by most recent: Turns out this is actually sorting by most recently added to DataONE, which is counter intuitive. Will add a feature request to have this changed.

Search by creator field: There are known issues with this that are being corrected in an indexing update.

Dataset location map: Confirmed that the marker disappears (bug documented, to be addressed in UI update). Zoom worked fine for me and buttons were shown (Chrome browser)

Thanks again for the very useful feedback.

Dave V.
