- Status changed from In Progress to Closed

Docs updated to be clear. The outcome is that case of parameter names and values should be preserved. This is especially important on the request generator side as the server implementation may choose to reject a request with malformed parameter names (e.g. getLogRecords called with a parameter named "fromdate" instead of "fromDate"). This approach is taken to reduce the complexity of implementation of both server and clients (i.e., reducing the number of special cases to be considered).

This applies to both parameters in URLs and parameter names in MIME multiart-mixed encoded bodies.
