Description One of those obvious requirements that just needs to be captured for consistency. Rationale Building infrastructure without a design is generally a bad thing to do, and typically leads to problems. e.g. things built in the wrong order, pieces that don't work as expected, incompatibilities between independently developed components, etc. Fit Criteria <ul style="list-style-type: none">• A design is available for all software being developed• The design can be effectively communicated with project participants• The design addresses the expected functionality, requirements, and capabilities.
