Description

Design questions:

Adding archived items to the index:

- 1.) Are data package relationships (documents, documentedBy, aggregatedBy) removed when a (data/science metadata) document is archived. Annotations, provanance, semantic fields?
- 2.) Are data package relationships removed when an ORE/data package document is archived?

Current definition of 'head of sid' chain requires archived objects to be present in the search index so that 'head of sid' chain resolution works the same as it does on CN

Why does finding the 'head of sid' chain rely on the solr index?

Current implementation removes archived objects from the search index.

Need to alter this to:

- add an archived property to the solr schema
- index only system metadata for archived objects (currently indexed objects need to be updated to remove other search fields such as title etc for science metadata)

Rejecting for now, use case story is unclear why/how these records would be used.
