

## Java Client - Task #7154

### Add capability in DataPackage to make statements about anonymous resources in Resource maps

2015-06-04 21:54 - Chris Jones

<b>Story Points:</b>			

#### Description

DataPackage currently provides insertRelationship() a method to provide any relationship using predicates from other namespaces (such as PROV) and URIs as subjects and objects. This doesn't allow for blank (anonymous) nodes. Overload the method to accept any blank nodes as subject and object components of the triple, and fix any tests that use this method. The underlying storage structure (tripleMap), will need to change the types it stores (currently just URIs), likely to a RDFNode subclasses.

Update the ResourceMapFactory to use the CITO vocabulary and remove the CITO\_DOCUMENTS and CITO\_IS\_DOCUMENTED\_BY static predicates. While Ben and Rob and I discussed changing the init() method to a static block, it throws a URISyntaxException, so I'd need to think about handling that. Leaving it for now. refs #7154

##### Revision 15743 - 2015-06-05 22:58 - Chris Jones

Clean up the ProvResourceMapBuilder so it no longer creates Predicates internally, but uses the PROV, ProvONE\_V1, and CITO vocabularies. Remove init() (no longer needed), and initialize the rdfModel in the constructor. Move setNamespaces() to the bottom - for some reason I added it above the constructor, which seems odd.

Change the signature of insertRelationship(ResourceMap, URI, Predicate, List) to insertRelationship(ResourceMap, Resource, Property, List) which gives us more flexibility in using more than just Node\_URI types in statements.

To support this, update DataPackage to use the new method signature. DataPackage now internally stores the tripleMap as a Map> (instead of URIs and Predicate). We'll then be able to add triple statements with anonymous nodes for the subject, and literals for the object. Stub out overloaded versions of the insertRelationship method to support these use cases. Work in progress. refs #7154

#### **Revision 15746 - 2015-06-06 23:01 - Chris Jones**

Modify ProvResourceMapBuilder.insertRelationship() to take a list of RDFNode objects as the objects for the triple statements. This will allow us to make statements using literal types, and not just Resources.

Update DataPackage to store triples in the tripleMap using RDFNode objects as well to conform to the change above. Overload insertRelationship() to take a single URI object to accommodate languages that don't support generics typing (like Matlab). Change the overloaded insertRelationship() method that took a String object to now be an Object literal. This is unimplemented yet - work in progress.

Overload RsourceMapFactory.createResourceMap() to allow for the creation of an unpopulated base resource map, and allow for a custom title. This will allow us to move away from the tripleMap structure in DataPackage that is too limiting when trying to insert non-aggregation related statements.

When calling ProvresourceMapBuilder.insertRelationship(), ensure that the statements being made do not result in orphaned nodes in the graph. Also, change the overloaded insertrelationship() method used for inserting blank node subjects to call insertRelationship(Resource, Property, RDFNode) to reduce code duplication.

**Revision 15764 - 2015-06-11 22:04 - Chris Jones**

This is a significant change in DataPackage to redesign how we store the triple statements. After having a design discussion with Ben regarding the limitations of using a Map>> structure, change the internal storage to be the ResourceMap itself. This removes the need of having 1) a metadataMap, and 2) a tripleMap. The tripleMap itself was the most problematic, in that it was impossible to ensure insertion order when creating a resource map from the LinkedHashMap because of repeating Predicate keys. Both maps are replaced by the resourceMap, which is basically just a list of RDF statements anyway.

In support of this, change the constructor to create a base resource map from ResourceMapFactory, and modify insertRelationship(Identifier, List) to build the ResourceMap instance up rather than the metadataMap. It now aggregates resources into the map, and describes them with other calls to insertRelationship(). Add a private aggregate() method to help with this. change getMap() to getResourceMap(), and change setMetadataMap() to setResourceMap(). Keep getMetadataMap() since it's helpful in serializing/deserializing using ResourceMapFactory. Change getDocumentedBy() to search the resource map rather than the old metadata map whaen returning a metadata identifier.

lastly, finish out the version of insertRelationship() that allows for statements with literals as the object.

**Revision 15764 - 2015-06-11 22:04 - Chris Jones**

This is a significant change in `DataPackage` to redesign how we store the triple statements. After having a design discussion with Ben regarding the limitations of using a `Map` structure, change the internal storage to be the `ResourceMap` itself. This removes the need of having 1) a `metadataMap`, and 2) a `tripleMap`. The `tripleMap` itself was the most problematic, in that it was impossible to ensure insertion order when creating a resource map from the `LinkedHashMap` because of repeating Predicate keys. Both maps are replaced by the `resourceMap`, which is basically just a list of RDF statements anyway.

In support of this, change the constructor to create a base resource map from `ResourceMapFactory`, and modify `insertRelationship(Identifier, List)` to build the `ResourceMap` instance up rather than the `metadataMap`. It now aggregates resources into the map, and describes them with other calls to `insertRelationship()`. Add a private `aggregate()` method to help with this. change `getMap()` to `getResourceMap()`, and change `setMetadataMap()` to `setResourceMap()`. Keep `getMetadataMap()` since it's helpful in serializing/deserializing using `ResourceMapFactory`. Change `getDocumentedBy()` to search the resource map rather than the old metadata map when returning a metadata identifier.

lastly, finish out the version of `insertRelationship()` that allows for statements with literals as the object.

**Revision 15787 - 2015-06-16 16:36 - Chris Jones**

Fix the `insertRelationship()` method that allows for blank node creation. To avoid inserting multiple blank nodes for each property being added, track blank nodes with the `DC_TERMS.identifier` property. This allows us to identify blank nodes across serializations of the resource map, since anonymous node identifiers themselves do not persist from one model to the next (like from Foresite to Jena) models. refs #7154

DataPackage.insertRelationship is now overloaded with a number of method options for adding triple statements. Note that some of the overloaded methods purposefully don't use Java generics, but rather plain classes, to support languages like Matlab that don't support generics.
