**Description**

The GMN version created for the bug fix for problem with process replication queue was deployed to pypi. However, only a few of the were included in the pypi distribution. 1.2.2 is the last version that Roger deployed, 1.2.5.x is the bug fix version.

name: dataone.generic_member_node-1.2.2.tar.gz (md5)    Source       date:2014-11-01 size:6MB
name: dataone.generic_member_node-1.2.5.3.tar.gz (md5)  Source       date:2015-07-24 size:2KB

Strangely, the v2 distribution worked without any problems. It contains all of the files that it's supposed to have.

I tried modifying setup.py:
if 'install' in sys.argv:
packages = setuptools.find_packages()
else:
packages = None
I removed the if statement so that it always calls setuptools.find_packages(). This allowed more files to be included, but still not all of them, such as the templates, static and js folders.
