ADC's corpus is quite large with a variety of object types represented. Chris said in an email 4/13/16:

There are close to 500,000 objects in total, and we've found 163 unique file extensions:

So, it's going to take some work to figure these out. For any of the non-obvious ones, we've used application/octet-stream as the formatId but will need to update system metadata before we start syncing.

It's *likely* that most of these would be classified as a DATA format (since they're not METADATA or RESOURCE), but some of them just look odd.
