| <p>The system should be able to revoke any user's permissions and, ultimately, their direct access to the system, if the user is misbehaving within the system.</p> <p>Although it is unclear as to who assigns permissions, I believe that the final responsibility and authority for access control is the <a href="#">DataONE</a> administrator. As such, permissions and simple access to any part of the <a href="#">DataONE</a> infrastructure, and perhaps member node infrastructure that is accessed through <a href="#">DataONE</a>, should be revokable.</p> <p>Fit Criteria</p> <ul style="list-style-type: none"><li>• Administrator can change permissions for a user for any object</li><li>• Permission changes are propagated through the system within XXX seconds</li><li>• Read, write access rules can be altered for a user for all content in the system</li></ul> |               |                        |           |
